1945. Sum of Digits of String After Convert

You are given a string s consisting of lowercase English letters, and an integer k.

First, **convert** s into an integer by replacing each letter with its position in the alphabet (i.e., replace 'a' with 1, 'b' with 2, ..., 'z' with 26). Then, **transform** the integer by replacing it with the **sum of its digits**. Repeat the **transform** operation k **times** in total.

For example, if s = "zbax" and k = 2, then the resulting integer would be 8 by the following operations:

- Convert: "zbax" → "(26)(2)(1)(24)" → "262124" → 262124
- Transform #1: 262124 → 2 + 6 + 2 + 1 + 2 + 4 → 17
- Transform #2: $\boxed{17 \rightarrow 1 + 7 \rightarrow 8}$

Return the resulting integer after performing the operations described above.

Example 1:

Input: s = "iiii", k = 1Output: 36 Explanation: The operations are as follows: - Convert: "iiii" \rightarrow "(9)(9)(9)(9)" \rightarrow "9999" \rightarrow 9999 - Transform #1: 9999 \rightarrow 9 + 9 + 9 + 9 \rightarrow 36 Thus the resulting integer is 36.

Example 2:

Input: s = "leetcode", k = 2
Output: 6
Explanation: The operations are as follows:
- Convert: "leetcode" \rightarrow "(12)(5)(5)(20)(3)(15)(4)(5)" \rightarrow "12552031545" \rightarrow 12552031545
- Transform #1: 12552031545 \rightarrow 1 + 2 + 5 + 5 + 2 + 0 + 3 + 1 + 5 + 4 + 5 \rightarrow 33
- Transform #2: 33 \rightarrow 3 + 3 \rightarrow 6
Thus the resulting integer is 6.

Example 3:

Input: s = "zbax", k = 2
Output: 8

Constraints:

- 1 <= s.length <= 100
- 1 <= k <= 10
- s consists of lowercase English letters.
